

Installation of MMReport

Simply copy the LibMMReport folder into your Delphi directory

In this example it is: C:\Program Files (x86)\Embarcadero\Studio\20.0

Open MMReports.bpl and build the components group. You will need to set the Library Paths to enable access. In Delphi 10 the place to do that is Tools/Options/Language/Delphi Options/Library. In Delphi XE6 it is Tools/Options/Environment Options/Delphi Options/Library

The directory contains additional files to the files directly associated with the component group which are available for additional software based on these components.

The MMReports.bpl provided has been created in Delphi 10.4. For other versions just create a new package and add the files under "Contains" shown in the screen shot above. For some earlier versions of Delphi you may need to edit the code in places.

The Application Example folder contains a very simple report using the default Delphi SQLite database example to help in how to implement the reporting package into an application. It also provides an example of running a user defined report created by the report writer.

The DesignDist directory contains the source code for a report writer to create user defined reports.

A copy of the data file TestReport.db is in the Data Directory.

An example of a user created report is in the Reports directory
